

Dear students (IXC) Science(Physics))

Teacher : BIPLAB DAS

Good morning .

Study materials for today (22nd May, 2020) .

Do the followings :

1. Write the 3rd law of motion (2 times) .

2. Do the questions 1 to 4 of page (126-127) .

3. Do the Exercises - Questions 01 to 18 (except 17) .

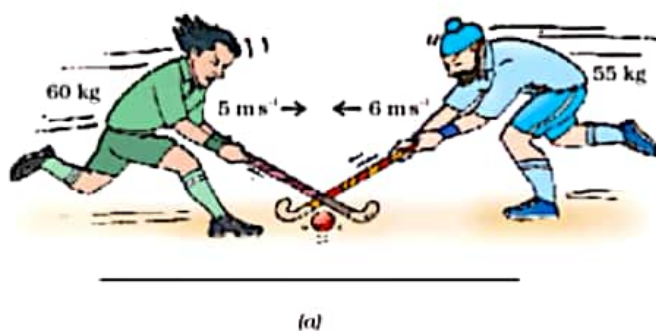

Home work will be uploaded by 8 pm (Tuesday, 26th May) .

25th May will be holiday on account of Id-ul-fitr .

That's all for today . Thanks

**Example 9.8** Two hockey players of opposite teams, while trying to hit a hockey ball on the ground collide and immediately become entangled. One has a mass of 60 kg and was moving with a velocity  $5.0 \text{ m s}^{-1}$  while the other has a mass of 55 kg and was moving faster with a velocity  $6.0 \text{ m s}^{-1}$  towards the first player. In which direction and with what velocity will they move after they become entangled? Assume that the frictional force acting between the feet of the two players and ground is negligible.

**Solution:**

**Fig. 9.19:** A collision of two hockey players: (a) before collision and (b) after collision.

Let the first player be moving from left to right. By convention left to right is taken as the positive direction and thus right to left is the negative direction (Fig. 9.19). If symbols  $m$  and  $u$  represent the mass and initial velocity of the two players, respectively. Subscripts 1 and 2 in these physical quantities refer to the two hockey players. Thus,

$$m_1 = 60 \text{ kg}; u_1 = + 5 \text{ m s}^{-1}; \text{ and}$$

$$m_2 = 55 \text{ kg}; u_2 = - 6 \text{ m s}^{-1}.$$

The total momentum of the two players before the collision

$$= 60 \text{ kg} \times (+ 5 \text{ m s}^{-1}) +$$

$$55 \text{ kg} \times (- 6 \text{ m s}^{-1})$$

$$= - 30 \text{ kg m s}^{-1}$$

If  $v$  is the velocity of the two entangled players after the collision, the total momentum then

$$= (m_1 + m_2) \times v$$

$$= (60 + 55) \text{ kg} \times v \text{ m s}^{-1}$$

$$= 115 \times v \text{ kg m s}^{-1}.$$

Equating the momenta of the system before and after collision, in accordance with the law of conservation of momentum, we get

$$v = - 30/115$$

$$= - 0.26 \text{ m s}^{-1}.$$

Thus, the two entangled players would move with velocity  $0.26 \text{ m s}^{-1}$  from right to left, that is, in the direction the second player was moving before the collision.

## Questions

1. If action is always equal to the reaction, explain how a horse can pull a cart.
2. Explain, why is it difficult for a fireman to hold a hose, which ejects large amounts of water at a high velocity.
3. From a rifle of mass 4 kg, a bullet of mass 50 g is fired with an initial velocity of  $35 \text{ m s}^{-1}$ . Calculate the initial recoil velocity of the rifle.

## CONSERVATION LAWS

All conservation laws such as conservation of momentum, energy, angular momentum, charge etc. are considered to be fundamental laws in physics. These are based on observations and experiments. It is important to remember that a conservation law cannot be proved. It can be verified, or disproved, by experiments. An experiment whose result is in conformity with the law verifies or substantiates the law; it does not prove the law. On the other hand, a single experiment whose result goes against the law is enough to disprove it.

The law of conservation of momentum has been deduced from large number of observations and experiments. This law was formulated nearly three centuries ago. It is interesting to note that not a single situation has been realised so far, which contradicts this law. Several experiences of every-day life can be explained on the basis of the law of conservation of momentum.

## What you have learnt

- First law of motion: An object continues to be in a state of rest or of uniform motion along a straight line unless acted upon by an unbalanced force.
- The natural tendency of objects to resist a change in their state of rest or of uniform motion is called inertia.
- The mass of an object is a measure of its inertia. Its SI unit is kilogram (kg).
- Force of friction always opposes motion of objects.
- Second law of motion: The rate of change of momentum of an object is proportional to the applied unbalanced force in the direction of the force.
- The SI unit of force is  $\text{kg m s}^{-2}$ . This is also known as newton and represented by the symbol N. A force of one newton produces an acceleration of  $1 \text{ m s}^{-2}$  on an object of mass 1 kg.
- The momentum of an object is the product of its mass and velocity and has the same direction as that of the velocity. Its SI unit is  $\text{kg m s}^{-1}$ .
- Third law of motion: To every action, there is an equal and opposite reaction and they act on two different bodies.
- In an isolated system, the total momentum remains conserved.

## Exercises

1. An object experiences a net zero external unbalanced force. Is it possible for the object to be travelling with a non-zero velocity? If yes, state the conditions that must be placed on the magnitude and direction of the velocity. If no, provide a reason.
2. When a carpet is beaten with a stick, dust comes out of it. Explain.
3. Why is it advised to tie any luggage kept on the roof of a bus with a rope?
4. A batsman hits a cricket ball which then rolls on a level ground. After covering a short distance, the ball comes to rest. The ball slows to a stop because
  - (a) the batsman did not hit the ball hard enough.
  - (b) velocity is proportional to the force exerted on the ball.
  - (c) there is a force on the ball opposing the motion.
  - (d) there is no unbalanced force on the ball, so the ball would want to come to rest.
5. A truck starts from rest and rolls down a hill with a constant acceleration. It travels a distance of 400 m in 20 s. Find its acceleration. Find the force acting on it if its mass is 7 metric tonnes (*Hint*: 1 metric tonne = 1000 kg.)
6. A stone of 1 kg is thrown with a velocity of  $20 \text{ m s}^{-1}$  across the frozen surface of a lake and comes to rest after travelling a distance of 50 m. What is the force of friction between the stone and the ice?
7. A 8000 kg engine pulls a train of 5 wagons, each of 2000 kg, along a horizontal track. If the engine exerts a force of 40000 N and the track offers a friction force of 5000 N, then calculate:
  - (a) the net accelerating force;
  - (b) the acceleration of the train; and
  - (c) the force of wagon 1 on wagon 2.
8. An automobile vehicle has a mass of 1500 kg. What must be the force between the vehicle and road if the vehicle is to be stopped with a negative acceleration of  $1.7 \text{ m s}^{-2}$ ?
9. What is the momentum of an object of mass  $m$ , moving with a velocity  $v$ ?
  - (a)  $(mv)^2$
  - (b)  $mv^2$
  - (c)  $\frac{1}{2} mv^2$
  - (d)  $mv$
10. Using a horizontal force of 200 N, we intend to move a wooden cabinet across a floor at a constant velocity. What is the friction force that will be exerted on the cabinet?
11. Two objects, each of mass 1.5 kg, are moving in the same straight line but in opposite directions. The velocity of each

- object is  $2.5 \text{ m s}^{-1}$  before the collision during which they stick together. What will be the velocity of the combined object after collision?
12. According to the third law of motion when we push on an object, the object pushes back on us with an equal and opposite force. If the object is a massive truck parked along the roadside, it will probably not move. A student justifies this by answering that the two opposite and equal forces cancel each other. Comment on this logic and explain why the truck does not move.
  13. A hockey ball of mass  $200 \text{ g}$  travelling at  $10 \text{ m s}^{-1}$  is struck by a hockey stick so as to return it along its original path with a velocity at  $5 \text{ m s}^{-1}$ . Calculate the change of momentum occurred in the motion of the hockey ball by the force applied by the hockey stick.
  14. A bullet of mass  $10 \text{ g}$  travelling horizontally with a velocity of  $150 \text{ m s}^{-1}$  strikes a stationary wooden block and comes to rest in  $0.03 \text{ s}$ . Calculate the distance of penetration of the bullet into the block. Also calculate the magnitude of the force exerted by the wooden block on the bullet.
  15. An object of mass  $1 \text{ kg}$  travelling in a straight line with a velocity of  $10 \text{ m s}^{-1}$  collides with, and sticks to, a stationary wooden block of mass  $5 \text{ kg}$ . Then they both move off together in the same straight line. Calculate the total momentum just before the impact and just after the impact. Also, calculate the velocity of the combined object.
  16. An object of mass  $100 \text{ kg}$  is accelerated uniformly from a velocity of  $5 \text{ m s}^{-1}$  to  $8 \text{ m s}^{-1}$  in  $6 \text{ s}$ . Calculate the initial and final momentum of the object. Also, find the magnitude of the force exerted on the object.
  17. Akhtar, Kiran and Rahul were riding in a motorcar that was moving with a high velocity on an expressway when an insect hit the windshield and got stuck on the windscreen. Akhtar and Kiran started pondering over the situation. Kiran suggested that the insect suffered a greater change in momentum as compared to the change in momentum of the motorcar (because the change in the velocity of the insect was much more than that of the motorcar). Akhtar said that since the motorcar was moving with a larger velocity, it exerted a larger force on the insect. And as a result the insect died. Rahul while putting an entirely new explanation said that both the motorcar and the insect experienced the same force and a change in their momentum. Comment on these suggestions.
  18. How much momentum will a dumb-bell of mass  $10 \text{ kg}$  transfer to the floor if it falls from a height of  $80 \text{ cm}$ ? Take its downward acceleration to be  $10 \text{ m s}^{-2}$ .
